

# C-Programming and DS

## Today Class Topics

-Hashing :-  $O(1)$

dominating operation

- ⇒ Unsorted Array =  $O(n)$  || linear search
- ⇒ Sorted Array =  $O(\log n)$  || Binary search
- ⇒ Linked List =  $O(n)$  || linear search
- ⇒ BST =  $O(\log n)$  || Avg case  
=  $O(n)$  || worst case
- ⇒ AVL-tree =  $O(\log n)$
- ⇒ Hashing =  $O(1)$

Hashing:- Searching Technique. [Good Hashing is  $O(1)$ ]

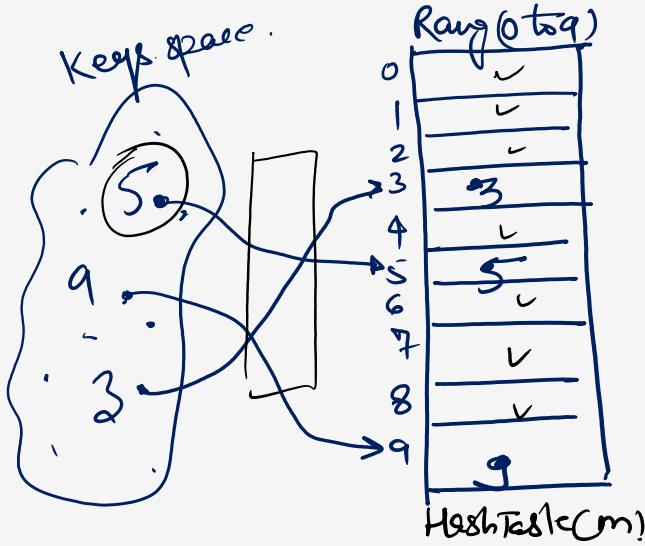

$\Rightarrow$  Worst case search time Complexity =  $O(1)$  [99%.]

$\Rightarrow$  The following Components are used in Hashing

- 1) Key space ( $n$ )
- 2) Hash function
- 3) Hash Table ( $m$ ) or Hash Bucket ( $m$ )

Direct Address Table (DAT) :- HashTable size ( $m$ ) = 10 (0 to 9)

Keys = ( 5, 4, 6, 9 )

¶

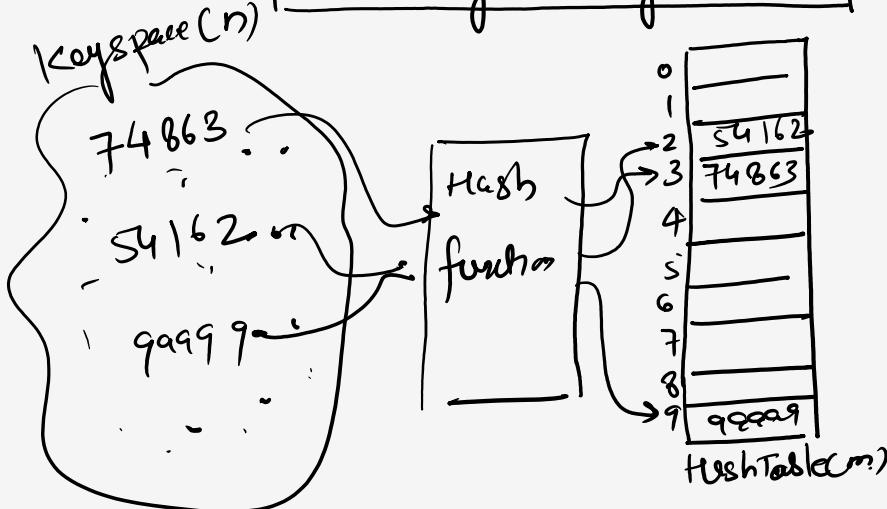

Hash function:

Adv: WC Search time =  $O(1)$

Hash function:-

$$HF(\text{Key}) = \text{Key mod } m$$

$$\begin{aligned} \text{HashTable size} &= m \quad (0 - m-1) \\ &= 10 \quad (0 - 9) \end{aligned}$$

$$\begin{aligned} HF(74863) &= 74863 \bmod 10 \\ &= 3 \end{aligned}$$

if Key = 899

$$H(899) = 9$$

Collision ↴

Collision Resolution  
Technique

Hash function:-       $\frac{1}{7}, \frac{15}{7}, \frac{22}{7}, \frac{29}{7}, \frac{36}{7}$       msb \_\_\_\_\_ LSB

1) Division modulo method:-

$$HF(\text{key}) = \text{key mod } m$$

Ex:  $m = 8 = 2^3 = 2^K$

$$HF(\text{key}) = \boxed{\text{LSB } K \text{ bits}}$$

1) key = 86 = 1010110  $\Rightarrow 86 \bmod 8 = 6 = \boxed{110}$

2) key = 102 = 1100110  $\Rightarrow 102 \bmod 8 = 6 = \boxed{110}$

3) key = 118 = 1110110  $\Rightarrow 118 \bmod 8 = 6 = \boxed{110}$

4) key = 126 = 1111110  $\Rightarrow 126 \bmod 8 = 6 = \boxed{110}$

if  $m = 7 \neq 2^3 \neq 2^K$

1) key = 86,  $86 \bmod 7 = 2$

2) key = 102,  $102 \bmod 7 = 4$

3) key = 118,  $118 \bmod 7 = 6$

4) key = 126,  $126 \bmod 7 = 0$

Collisions

NOTE:

1) do not choose  $m$  value as exactly power of 2

2) choose the  $m$  value as prime number which is not near to power of 2 then it will give less no. of collisions

2) mid square method:-  $m = 1000 \ (0 - 999)$

Key = 786

$$(Key)^2 = (786)^2 = 6(77)96$$

↑↑↑↑↑↑  
543210

Index	key
177	786

$\Rightarrow$  it is good hash function

$\Rightarrow$  Counter Example is difficult to generate

### 3) Digit Extraction method:-

Key = 73 4 6 8 1 4 3  
↓ ↑ ↓ ↑ ↓ ↑ ↓  
7 8 5 4 3 2 0

Index	Key
486	7 3 4 6 8 1 4 2

⇒ it is bad Hash function

⇒ Counterexample is easy to generate

4) Folding method:-

a) Fold Boundary method:-

~~Bad Hash funcn~~

$$\text{key} = 734 \leq 8143$$

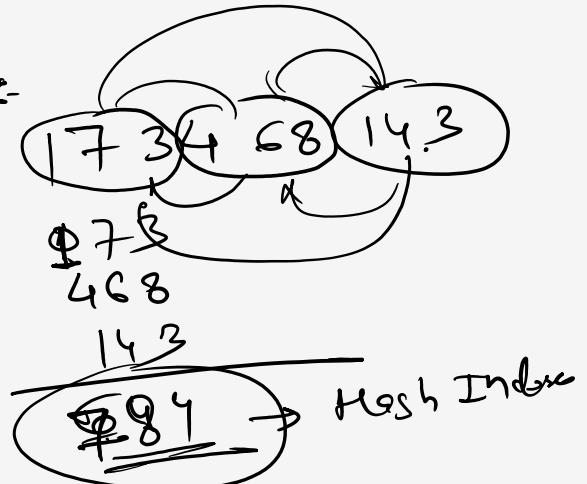

$$\text{key} = 7 \boxed{34} 68 \boxed{14} 3$$

$$\begin{array}{r} 734 \\ 143 \\ \hline 877 \end{array}$$

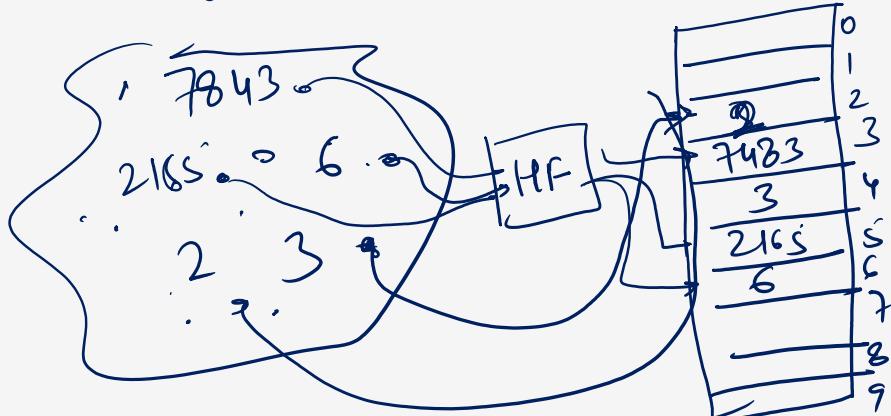

Index	Key
877	73468143

b) Fold shifting method:-

~~Bad Hash funcn~~

Hashing :- mapping larger set to smaller set (many to one)

$$H(key) = key \bmod m$$

Let  $m = 10$

Secret 7843

$$H(7843) = 7843 \bmod 10$$

= 3

Problem: Collision

How to Remove Collision :

1st select better Hash function

→ 99% No Collision

if 1% Collision Then apply collision Resolution Technique

→ use Better Hash function But never say no Collision

→ use Collision Resolution Technique (CRT)

## Collision Resolution Technique (CRT) :-

### → Chaining (outsideTable)

“ Key value will be stored outside hashTable ”

→ Insertion from beginning always ”

→ No overflow

→ Deletion is easy as Compared to open Addressing.

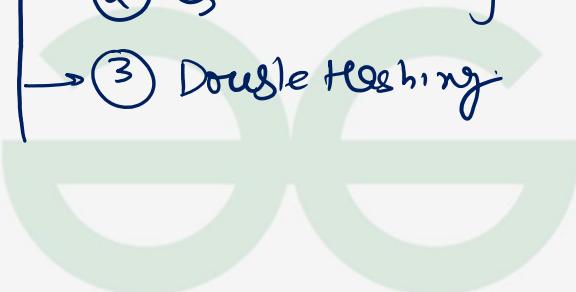

### → Open Addressing or closed Hashing (InsideTable)

“ Key will be stored inside hashTable ”

→ Deletion is Complex

→ Overflow

- ① Linear Probing
- ② Quadratic Probing
- ③ Double Hashing

Chaining :- let  $M = 10$  ( $0-9$ ),  $H(K) = K \bmod m$

Keys = 10, 55, 69, 74, 52, 65, 79, 85, 44, 75

0	3000	10   Null } 1 3000
1	Null } 0	52   Null } 1 5000
2	5000	44   6825 } 2 4000
3	Null } 0	74   Null } 2 6825
4	4000	75   6000 } 0 1000
5	1000	85   9000 } 4 6000
6	Null } 0	65   7826 } 5 9000
7	4000 } 0	55   Null } 4 7826
8	Null } 0	85 }
9	2000	79   7000 } 2 2000

Hash Table

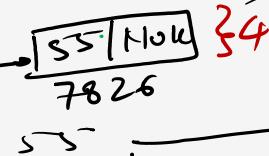

Q

$$H(10) = 10 \bmod 10 = 0$$

$$H(55) = 55 \bmod 10 = 5$$

$$\begin{array}{r} 1+0+1+0+2+4+0+0+0+2 \\ \hline 10 \end{array} \rightarrow \frac{10}{10} = 1$$

$\Rightarrow (4, 0, 1)$

Longest chain length = 4 ✓

min. chain length = 0 ✓

Avg. chain length = 1 ✓

## Remarks

- 1) It can handle unlimited no. of collision (no overflow)
  - 2) Inefficient utilization of memory
  - 3) longest chain length with  $n$  keys is  $n$
  - 4) Deletion & Insertion easy as compared to open addressing
- 10, 20, 30, 40, 50, 60, 70, 80, 90, 100

TC	BC	WC
Insertion	$O(1)$	$O(n)$
Searching	$O(1)$	$O(n)$
Deletion	$O(1)$	$O(n)$

Analysis :- Search time =  $O(1 + \alpha)$  load factor

$\Rightarrow O(1)$

Complete hash function  $\Rightarrow O(1 + k)$  constant

load factor :- maximum load allocated to each slot

The no. of keys getting stored in one slot is called as load factor

$$\text{load factor } (\alpha) = \frac{n}{m}$$

let  $m = km \Rightarrow \alpha = \frac{km}{m} \Rightarrow \alpha = k$

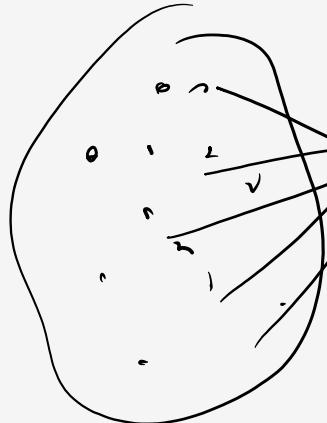

size of Hash table  $\Rightarrow O(1)$

Open Addressing :- (Closed Hashing):

We can not insert more than m Keys inside the table

$$\alpha = \frac{n}{m} \Rightarrow \boxed{0 \leq \alpha \leq 1}$$

$n \leq m$

hash table

size of table = m

1) Linear Probing :- Attempt or checking

let  $m = 10$  (0-9)

$$\text{HF}(key) = \text{key} \bmod m$$

$$LP(key, i) = (\text{HF}(key) + i) \bmod m$$

$i = 0, 1, 2, 3, \dots, m-1$

Ex. Keys(n) = ~~25, 38, 43, 68, 79, 46, 58, 68, 20~~

1)  $LP(25, 0) = 5 + 0 = 5 \checkmark$

2)  $LP(38, 0) = 8 + 0 = 8 \checkmark$

3)  $LP(43, 0) = 3 + 0 = 3 \checkmark$

4)  $LP(68, 0) = 8 + 0 = 8$  Collision

$LP(68, 1) = 8 + 1 = 9 \checkmark$

5)  $LP(79, 0) = 9 + 0 = 9$  Collision

$LP(79, 1) = 9 + 1 = 10 \equiv 0 \checkmark$

6)  $LP(46, 0) = 6 \checkmark$

7)  $LP(58, 0) = 8 + 0 = 8$  Collision

$$= 8 + 1 = 9$$

$$= 8 + 2 = 0$$

$$= 8 + 3 = 1$$

8)  $LP(65, 0) = 5$  Collision

$65, 1 = 6$  Collision

$68, 2 = 7 \checkmark$

9)  $LP(20, 0) = 0$  Collision

$20, 1 = 1$  Collision

$20, 2 = 2 \checkmark$

80 90  
Primary clustering

## Primary clustering :-

- 1) if two keys are mapped on to same starting location of the Hash Table then they both follow the same path in the linear manner because of this the search time complexity will increase
- 2) To Avoid this Problem the Quadratic Probing will be used

## Deletion

Chaining is better for Deletion.

Question:-  $M = 10$ ,  $H(K) = K \bmod m$ ,  $CRT = LP$ , After inserting 6 values into an empty HashTable shown below

A) In which sequence Key value could have been inserted to get the above HashTable.

- a) 46, 42, 34, 52, 23, 33
- b) 34, 42, 23, 52, 33, 46
- c)  $\Rightarrow$  46, 34, 42, 23, 52, 33
- d) 42, 46, 33, 23, 34, 52

B) How many different insertion sequence Possible to get above HashTable 30 ?

7 Ans

2 : 40 pm

10 min Break

2) Quadratic Probing :-  $HF(\text{key}) = \text{Key mod } m$ ,  $m=10 (0 \rightarrow 9.)$

$$QP(\text{key}, i) = (HF(\text{key}) + C_1 * i + C_2 * i^2) \bmod m$$

where  $C_1 = 1, C_2 = 1, i = 0, 1, 2, \dots - 9 (m-1)$

Ex: keys( $n$ ) = ~~28, 98, 57, 75, 97, 18, 78, 46~~

$$1) QP(28, 0) = 5 + 0 + 0 = 5$$

$$2) QP(98, 0) = 8 + 0 + 0 = 8$$

$$3) QP(57, 0) = 7 + 0 + 0 = 7$$

$$4) QP(75, 0) = 5 + 0 + 0 = 5 \text{ (Collision)}$$

$$QP(75, 1) = 5 + 1 + 1 = 7 \text{ Collision}$$

$$QP(75, 2) = 5 + 2 + 4 = 1$$

$$5) QP(97, 0) = 7 \text{ Collision}$$

$$QP(97, 1) = 9$$

$$6) QP(18, 0) = 8 \text{ Collision}$$

$$= 0$$

$$7) QP(78, 0) = 8 \text{ Collision}$$

$$= 0$$

$$8) QP(46, 0) = 6$$

Resultant Hash Table( $m$ )

0	18
1	75
2

8	98
9	97

Question:

Keys = 41, 60, 82, 93, 70, 80

$$H(K) = K \bmod m$$

$$m = 10(0-9)$$

$$q = c_2 - 1$$

$$Op = ?$$

Secondary clustering  
Primary

$$HT[?] = 80$$

$$Op(80,0) = 0 \text{ collision}$$

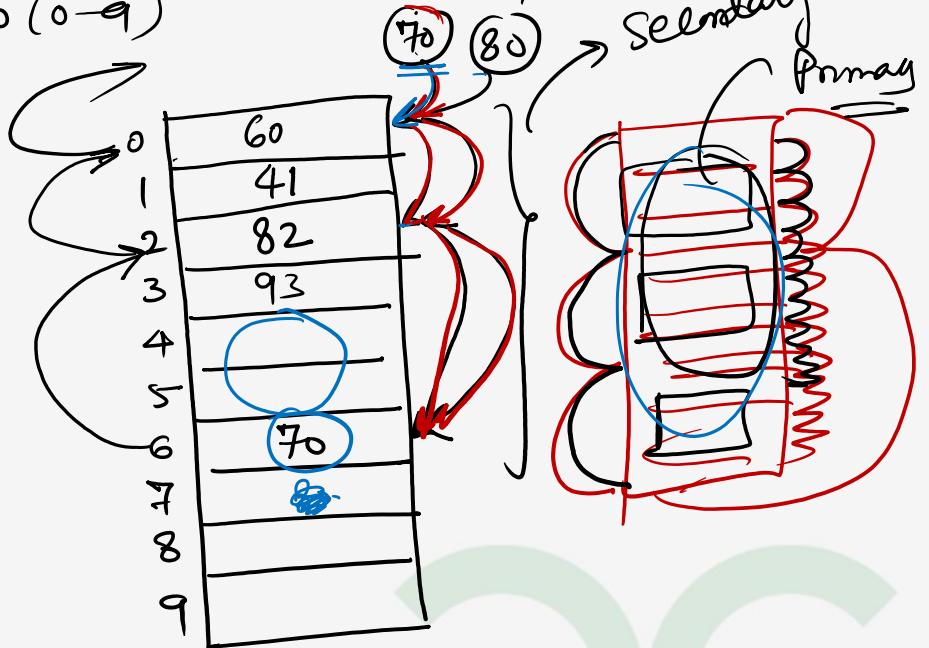

$$Op(80,1) = 2 \text{ collision}$$

$$Op(80,2) = 6 \text{ collision}$$

$$Op(80,3) = 2 \text{ collision}$$

$$Op(80,4) = 0 \text{ collision}$$

$$Op(80,5) =$$

## Secondary clustering :-

if two keys are mapped on to same starting location in the hash Table  
then they both follow the same path in the Quadratic manner because of  
the search time Complexity will increase

Note:-

TC	BC	WG
Insertion	$O(1)$	$O(m)$
Searching	$O(1)$	$O(m)$
Deletion	$O(1)$	$O(m)$

Note:-

To avoid this problem Double hashing will be used

3) Double Hashing :-

$$HF_1(\text{key}) = \text{key} \bmod m$$

$$m=10 \quad (0 \rightarrow 9)$$

$$HF_2(\text{key}) = 1 + (\text{key} \bmod (m-2))$$

$$e=0, 1, 2, 3, \dots, m-1$$

$$DH(\text{key}, e) = (HF_1(\text{key}) + e \cdot HF_2(\text{key})) \bmod m$$

Ex:- keys(n)= 25, 98, 57, 75, 97, 18, 78, 68, 46

$$\text{DH}(25, 0) = 5$$

$$\text{DH}(98, 0) = 8$$

$$\text{DH}(75, 0) = 5 \text{ (Initial)}$$

$$\text{DH}(75, 1) = (5 + 1 + 3) \bmod 10 = 9$$

9	75

TC	BC	WC
Insertion	$O(1)$	$O(m)$
Searching	$O(1)$	$O(m)$
Deletion	$O(1)$	$O(m)$

$\boxed{WC = O(1)} \quad [99.1.]$

universal  
Hashing  $\Rightarrow O(1)$

NOTE:-

1) The expected no. of Probes in an unsuccessful search of open Addressing

Technique is =  $\frac{1}{1-\alpha}$ , where  $\alpha$  is load factor =  $n/m$

2) The expected no. of probes in Successful search of open Addressing

Technique is =  $\left\lceil \frac{1}{\alpha} \log \frac{1}{1-\alpha} \right\rceil$ , where  $\alpha$  is load factor

$$\alpha = \frac{n}{m}$$
